## Sandwich panel wall

HIPERTEC® Wall installation manual

### 1. Direction of installation

HIPERTEC® Wall panels can be installed either vertically or horizontally. For horizontal installation panels are mounted from bottom-up. For vertical installation the panels need to be aligned against the main weather direction. The panels are to be installed and fixed by placing them on support profiles at the base. For horizontal installation the vertical joints need to be sealed properly and covered by pilaster strips or other suitable flashings.

### 2. Installation

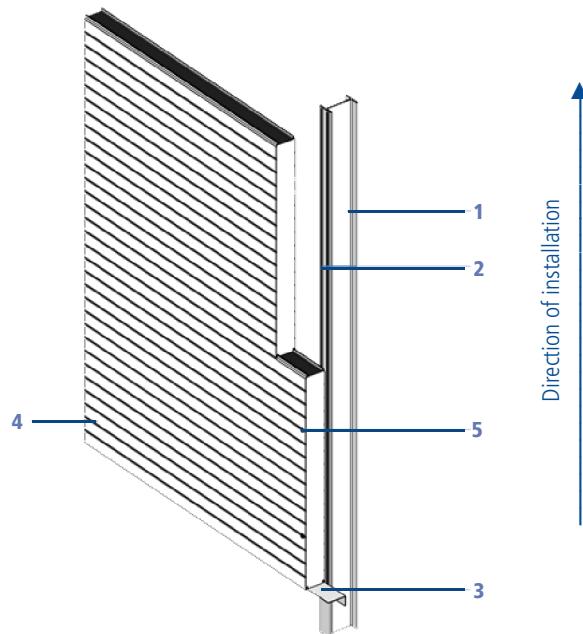

The first panel needs to be aligned perfectly and fixed immediately. The given building width of the panel needs to be maintained thoroughly; check measurements need to be performed every few panels. We recommend the use of Metecno-pressing tools for the installation of wall panels.

### Installation manual for download

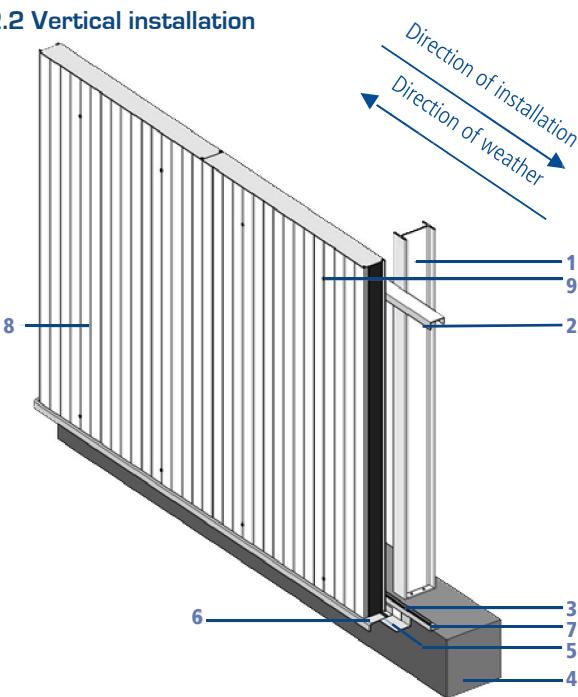

Connections to adjacent structures must be performed in professional and thorough manner.

#### 2.1 Horizontal installation

1. support structure, 2. sealing tapes, 3. supporting profile, 4. sandwich panel HIPERTEC® Wall, 5. fastener

#### 2.2 Vertical installation

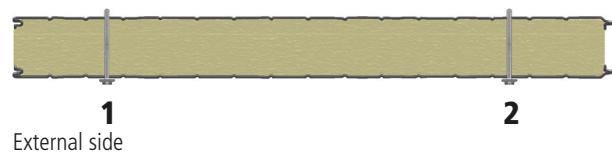

1. support structure, 2. bay rail 3. sealing tape, 4. base, 5. supporting profile, 6. dripping profile, 7. mounting angle, 8. sandwich panel HIPERTEC® Wall, 9. fastener

minimum support width:  
end bearing  $\geq 40$  mm  
middle bearing  $\geq 60$  mm  
joint area  $\geq 86$  mm (for horizontal installation, larger support widths may be necessary due to structural requirements)

### 3. Fixing

The necessary number of screws is defined by structural requirements (fastener supporting documents). Screws are to be drilled through from the external side directly into the support structure. Additional sealing of longitudinal joint or additional screwing of the joint itself is not necessary. Execute screw connection as uniform and consistent as possible. Construction-wise, all panels need to be fastened with at least two screws on both end- and middle bearing.

Internal side

## Sandwich panel wall

### HIPERTEC® Wall installation manual

## 4. Fixing material

For fastening sandwich panels, only fixing material with EPDM-gasket according German "bauaufsichtliche Zulassung Nr.14.4-407" or according European technical approval (ETA) must be used.

### 4.1 Fixing on steel support structure

Minimum diameter for approved screws is generally 5,5mm (depending on supplier). The required screw length may vary depending on supplier and is defined by:

- thickness of the sandwich panel HIPERTEC® Wall
- material strength of the support structure ( $t \geq 1,50$  mm)
- clamping width

The following table shows minimum screw lengths for the various core thicknesses of HIPERTEC® Wall:

Type of fastener	self-drilling screw	thread-rolling screw
Panel thickness (mm)	(mm)	(mm)
50	≥ 80	≥ 70
60	≥ 90	≥ 80
80	≥ 110	≥ 100
100	≥ 130	≥ 120
120	≥ 150	≥ 140
150	≥ 180	≥ 170
200	≥ 230	≥ 220

Self-drilling screws must be drilled through the support structure. Additional instructions by screw-supplier need to be considered as well.

### 4.2 Fixing on wooden support structure

Minimum diameter for approved screws is generally 6,0 mm (depending on supplier). The required screw length may vary depending on supplier and is defined by:

- thickness of the sandwich panel Hipertec Wall
- minimum screwed-in depth (lef  $\geq 50$  mm)
- clamping width

The following table shows minimum screw lengths for the various core thicknesses of HIPERTEC® Wall:

Type of fastener	self-drilling screw	thread-rolling screw
Panel thickness (mm)	(mm)	(mm)
50	≥ 110	≥ 70
60	≥ 120	≥ 80
80	≥ 140	≥ 100
100	≥ 160	≥ 120
120	≥ 180	≥ 140
150	≥ 210	≥ 170
200	≥ 260	≥ 220

We recommend having the screws being checked and retightened (if needed) approximately 3 months after installation.

## 5. Distance between fasteners

The distance between fasteners needs to be followed according to Z-10.49-517 as well as the minimum edge distances for wooden support structures according DIN EN 1995-1-1.

### 5.1 Distances perpendicular towards clamping direction

Minimum distance for fasteners towards the longitudinal edges is 100mm; minimum distance of fasteners among each other is 100mm.

### 5.2 Distances parallel towards clamping direction

Minimum distance for fasteners towards the cross edges of the wall panels is 20mm plus 3-times the screw diameter; minimum distance of fasteners among each other equals distance of support construction.

## 6. Connections

### 6.1 General notes

Connections of wall panels towards adjacent parts of the building need to be realized according German Z-10.49-517, according Metecno-connection details as well as according IFBS-rules. Deviant or additional installation steps may be necessary in case of fire resistance requirements according Z-19.52-2096.

### 6.2 Upper connections

The joint between wall-and roof panels is to be sealed against convection and diffusion with adequate flashings and sealing tapes. The remaining cavity is to be filled with mineral wool.

### 6.3 Roof parapet

Minimum distance between sandwich panel and parapet-profile is 6mm. The parapet-flashing needs to have a minimum slope of 5°.

### 6.4 Lower connections (base)

Wall panels need to be set onto a supporting profile to accomplish a horizontal edge along the building line. Panels must not be placed directly onto the base or dripping profile (use mounting aid, e.g. wooden ledge). We recommend a distance of 10mm, essentially 6mm at minimum. The dripping profile needs to have a minimum slope of 5° directed outwards. The dripping edge needs to have minimum distance of 20mm towards the underlying wall. Scarf joints need to be provided with an adequate flashing. For vertical installation, a shim of ca.20mm of the mineral wool core needs to be extracted from behind the external sheet.

### 6.5 Small openings

Pipe penetrations in the joint areas of the panel are to be avoided. Openings in wall panels smaller than 200mm x 200mm resp. Ø max. 200mm do not require additional support construction and me be realized with adequate sleeves (adapted to the profile geometry of the panel) with circular sealing. For openings in the joint area of the panel,

## Sandwich panel wall

### HIPERTEC® Wall installation manual

the draining water needs to be dissipated securely outwards on the external layer of the joint. Multiple small openings need to be aligned with minimum disturbance to the panel (e.g. parallel and perpendicular offset of the openings). Bigger openings require a supporting substructure along the edges which both panel and adjacent building parts are fastened to.

#### 6.6 External corner flashings

Joints on external corners of the building need to be sealed with mineral wool and covered with flashings.

#### 6.7 Longitudinal joint

To assure sufficient compression of the provided sealing tapes, the given building width of the panel needs to be maintained thoroughly. This should be done by check measurements every few meters (on the top and bottom for vertical installation; left and right for horizontal installation as well as above and below middle bearing). Protective foil is to be removed from the joints duly before fastening.

#### 6.8 Lateral joint

For lateral joints between two wall panels, a minimum supporting width of 86mm is required (joint min.6mm). Vertically installed wall panels require a butt connection in the lateral joint with a dripping profile in between. Joints need to be sealed with adequate sealant/sealing tapes.

Vertical pilaster strips allow versatile visual possibilities for horizontally installed wall panels. However, larger supporting widths may be necessary depending on the type of design.

Possible variants for covering of lateral joint:

##### 1. Flashing, e.g. hat-profile

- supporting width  $\geq$  100 mm

##### 2. Extruded aluminum sheath pilaster profile 130

- supporting width  $\geq$  130 mm

(see detail: lateral joint for horizontal installation of wall panels XX.08.02)
